Education

Indian Institute of Information Technology, Allahabad *June 2019 – June 2023*
B.Tech in Electronics & Communication Engineering

Technical Skills

Languages: Java, Go, JavaScript, C, C++

Backend: Spring Boot, REST APIs, Apache Kafka, WebSocket

Frontend: React, Next.js, Node.js

Databases: MySQL, MongoDB, Redis, PostgreSQL

DevOps: Docker, Kubernetes, Git

Concepts: Microservices, event-driven architecture, system design, data structures & algorithms

Experience

Software Development Engineer – Paytm *June 2026 – Present*
Bengaluru, India

Paytm Travel – Hotels Platform

- Develop **supplier data synchronization** services in **Go** to ingest hotel mappings and content from external providers, with reliable job scheduling, database-backed progress tracking, and incremental sync (new, updated, and removed hotels).
- Design **Kafka-based pipelines** that batch fetch work, publish per-hotel events, and hand off to downstream consumers with clear ownership between sync workers and content services.
- Build and extend the **hotel content management (CMS)** flow: validate and normalize supplier data, maintain canonical hotel identities and supplier mappings, store raw and curated content in **MongoDB**, and emit lifecycle updates for search and recommendation systems.
- Contribute to the **end-to-end booking journey** across **Java/Spring Boot** microservices—search, availability, room selection, and cart/review—including BFF aggregation for the web app, **Redis** caching, and integrations with supplier connectivity layers.
- Roll out changes safely using **feature flags**, structured logging, and local/integration testing across multiple independently deployable services.

Software Development Engineer – Jio Platforms Limited *June 2023 – June 2026*
Bengaluru, India

JioTalkie

- Delivered real-time **SOS alert** processing using an **event-driven** design and targeted notifications so responders get the right alerts under high concurrency.
- Improved reliability with **WebSocket** reconnection, heartbeats, lean message payloads, and caching for alerts and location data on unstable networks.

Projects

2x2 Rubik's Cube Solver – Mechanical Solver (C++, Arduino)

- Implemented bidirectional BFS to minimize solve moves; drove a physical solver with Arduino-controlled robotic arms.

Accomplishments

- Solved **1000+** coding problems on LeetCode, CodeForces, CodeChef, GeeksForGeeks, InterviewBit, and Pepcoding.
